In the Specification:

On page 1, insert above line 1, insert--Priority Claim

The present application claims priority on European Patent Application 03257553.2 filed December 1, 2003.--

Paragraph on line 26 of page 3 has been amended as follows:

- --Accordingly, the present invention relates to a process for operating a compression ignition internal combustion engine in combination with a catalytic partial oxidation reformer according to claim 1 : wherein:
- (a) a mixture of a first fuel and air, wherein the first fuel comprises Fischer-Tropsch derived fuel, is introduced in the combustion chamber of the engine;
- (b) exhaust gas is discharged from the engine and optionally partly recirculated to the combustion chamber of the engine;
- (c) a second fuel and oxygen and/or steam are supplied to the catalytic partial oxidation reformer to produce synthesis gas, wherein the second fuel comprises Fischer-Tropsch derived fuel; and
- (d) at least part of the synthesis gas is supplied to:
- (i) the exhaust gas aftertreater;
- (ii) the combustion chamber of the engine; or to both.--

Paragraph on line 1 of page 4 has been amended as follows:

--Figure 1 shows a process according to <u>an embodiment of</u> the invention wherein synthesis gas is supplied to a NO_X abatement system.--

Paragraph on line 4 of page 4 has been amended as follows:

--Figure 2 shows a process according to <u>an embodiment of</u> the invention wherein synthesis gas is supplied to the combustion chamber of the engine.--

Paragraph on line 7 of page 4 has been amended as follows:

--Figure 3 shows a process according to <u>an embodiment of</u> the invention wherein synthesis gas is supplied to the combustion chamber of the engine together with recirculated exhaust gas.--

Paragraph on line 11 of page 4 has been amended as follows:

--Figure 4 shows a process according to <u>an embodiment of</u> the invention wherein synthesis gas is supplied to both a NO_X abatement system and a solid oxide fuel cell.--

Paragraph on line 4 of page 6 has been amended as follows:

--The use of Fischer-Tropsch derived fuel in a compression ignition internal combustion engine has several advantages. These fuels are highly paraffinic and thus have a high cetane number. Also, there these fuels have a low sulphur content, thereby reducing the risk of sulphur poisoning of any catalytic system. Moreover, these fuels are inherently clean and thus result in lower emissions of particles (soot), NO_x, hydrocarbons and carbon monoxide.
